

Consider two random variables  $X$  and  $Y$  that are indicator random variables for (respectively) events  $A$  and  $B$ . Recall that this means  $X=1 \leftrightarrow A$  occurs,  $X=0$  otherwise.  $Y=1 \leftrightarrow B$  occurs,  $Y=0$  otherwise. (def:  $A$  and  $B$  are independent events if and only if  $X, Y$  independent random variables.)

$$P_{X,Y}(1,1) = P(A \cap B) \stackrel{\text{equal}}{\underset{\substack{\uparrow \\ \text{if and only if}}}{} \underset{\substack{\uparrow \\ A, B \text{ indep.}}}{\underset{\substack{\uparrow \\ \text{if and only if}}}{} \left\{ \begin{array}{l} P_{X,Y}(1,0) = P(A \cap B^c) \\ P_X(1)P_Y(0) = P(A)P(B^c) \end{array} \right. } \underset{\substack{\uparrow \\ \text{equal if and only if}}}{} \underset{\substack{\uparrow \\ A, B \text{ independent}}}{\underset{\substack{\uparrow \\ \text{if and only if}}}{} }$$

$$P_{X,Y}(0,0) = P(A^c \cap B^c) \stackrel{\text{equal iff}}{\underset{\substack{\uparrow \\ A, B \text{ indep.}}}{\underset{\substack{\uparrow \\ \text{if and only if}}}{} \left\{ \begin{array}{l} P_{X,Y}(0,1) = P(A^c \cap B) \\ P_X(0)P_Y(1) = P(A^c)P(B) \end{array} \right. } \underset{\substack{\uparrow \\ \text{if and only if}}}{} \underset{\substack{\uparrow \\ A, B \text{ indep.}}}{\underset{\substack{\uparrow \\ \text{if and only if}}}{} }$$

So in summary, random variables  $X, Y$  are independent exactly when events  $A, B$  are independent.
